Allowable Subject Matter

Claims 1-22 are allowed.

The following is an examiner's statement of reasons for allowance:

The cited prior art taken alone or in combination does not fairly suggest the claimed invention of to the integration of queuing network modeling and inference techniques to the model and automated performance of computer systems. Specifically, claims 1 and 12 are directed to receiving system topology and transaction flow data, generating a performance model of the distributed data system using system topology and transaction data flow, receiving performance data, inferring service demanding parameter using performance data and parameterize the performance model with set of service demand parameter that are determining using the inferred service demand parameters. Cited prior art teaches modeling tool in which the service demand parameters are user-defined data are manual and construct performance model based on user specification. Thus, cited art fails to teach receiving system topology and transaction flow data, generating a performance model of the distributed data system using system topology and transaction data flow, receiving performance data, inferring service demanding parameter using performance data and parameterize the performance model with set of service demand parameter that are determining using the inferred service demand parameters. Therefore, the claimed invention improves on efficiently providing architects and engineers with qualitative and quantitative insights about the system under consideration and shortens the turn around time in performance assessment, prediction and capacity planning.
